Exercise 1:-

Functional:

- The system shall allow users to log in with their passwords and usernames and compares them to a database that has them secured.
- The system shall allow students to search for a course available in the database, and allow them to register it and updates the database accordingly.
- The system shall allow the administration to view the number of students registered in each course from the database.

Non-Functional

- The system should be secured when dealing with login information, as well as be quick to log in. (security)
- The system should handle a large number of students within a registration period and update the database quickly. (capacity)
- The system should retrieve the number of registered students quickly and in less than one second. (performance).

Exercise 2:-

Functional:

- The system shall send a confirmation message after a successful payment and update order status.
- The system shall send email notifications to customers when an order status is changed, for tracking, or for promotions.
- The system shall allow admins to manage orders and update product availability throughout a database, which tracks available quantity automatically.

Non-Functional:

- The payment confirmation message should show up quickly and be easy to read. (Performance)
- The notification service should be working 24/7, as well as deliver within one minute (availability) (performance)
- The system should be able to quickly recover any lost data after any crashes.(reliability) (performance)
